

BENT KNEES BENCH DIPS

1. For this exercise you will need to place a flat bench behind your back while holding (very firm) on to the edge of that bench as you keep your hands close to your body while spread at shoulder width apart. Your arms should be fully extended with your elbows locked while carrying your body's weight up.
2. Place your feet firm on the ground at about an arm's length away from the bench, with your knees bent and your legs close to each other. This will be your starting position.
3. Slowly start lowering down your body by bending your elbows until you've lowered yourself far enough to an angle that is slightly less than 90 degrees between your upper arms and your forearms. Make sure not to dip yourself too far down that you end up overstraining or injuring your shoulders, and try to keep your elbows close to your body throughout the entire movement.
4. Now use your triceps muscles to push/raise your upper body all the way back up to its starting position, while keeping your triceps fully muscles engaged and under constant tension.
5. Repeat this motion for the recommended amount of repetitions.

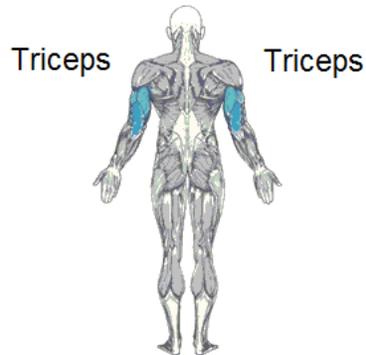

CAUTION: STOP immediately if you felt any sharp pain in your lower back, shoulders, chest, elbows, wrists and/or triceps muscles. Make sure to use a flat bench that is absolutely firm and stable on the ground (not shaky) to avoid any possibility of your hands slipping off the bench and getting yourself injured.
