

BENCH KNEE RAISES

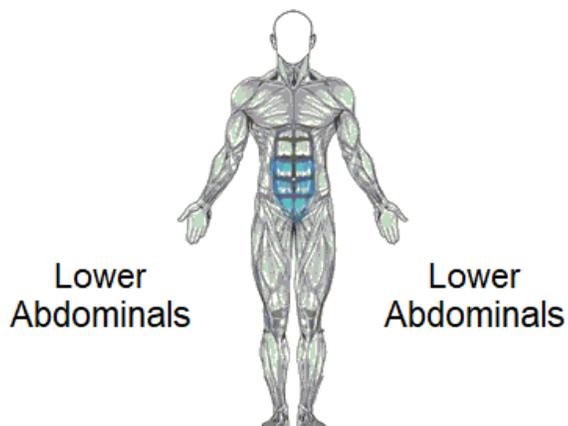

1. Lie flat on your back on a stable/flat bench with your legs fully extended and your hands holding firm onto the bench seat from both sides. This will be your starting position.
2. Raise & pull your knees towards your midsection by contracting your lower abdominal muscles and hip flexors. Continue the motion until your knees are past being perpendicular to the floor and closer to your midsection and your lower legs (calves) are parallel to the floor.
3. Return your legs back down to their starting position while keeping your lower abdominal muscles and hip flexors fully engaged and under constant tension. Make sure to keep your torso and your arms stationary on the bench throughout the entire movement.
4. Repeat this motion for the recommended amount of repetitions.

CAUTION: STOP immediately if you felt any sharp pain in your midsection (abdominal muscles), hips and/or lower back while performing this exercise.
